

## PHY 111: Introduction to Physics PROBLEMS

**Q1.** An object of mass  $4\text{ kg}$  moves round a circle of radius  $6\text{ m}$  with a constant speed of  $12\text{ m/s}$ . Calculate:

- (i) the angular velocity,
- (ii) the force towards the centre.

**Q2.** An object of mass  $10\text{ kg}$  is whirled round a horizontal circle of radius  $4\text{ m}$  by a revolving string inclined to the vertical. If the uniform speed of the object is  $5\text{ m/s}$ , calculate:

- (i) the tension in the string
- (ii) the angle of inclination of the string to the vertical.

**Q3.** A racing-car of  $1000\text{ kg}$  moves round a banked track at a constant speed of  $108\text{ km/hr}$ . Assuming the total reaction at the wheels is normal to the track, and the horizontal radius of the track is  $100\text{ m}$ , calculate the angle of inclination of the track to the horizontal and the reaction at the wheels.

**Q4.** Assuming that the mean density of the earth is  $5500\text{ kg/m}^3$ , that the constant of gravitation is  $6.7 \times 10^{-11}\text{ Nm}^2\text{kg}^{-2}$ , and that the radius of the earth is  $6400\text{ km}$ , find a value for the acceleration due to gravity at the earth's surface. Derive the formula used.

**Q5.** A copper wire,  $200\text{ cm}$  long and  $1.22\text{ mm}$  diameter, is fixed horizontally to two rigid supports  $200\text{ cm}$  long. Find the mass in *grams* of the load which, when suspended at the mid-point of the wire, produces a sag of  $2\text{ cm}$  at that point. Young's modulus for copper =  $12.3 \times 10^{10}\text{ Nm}^{-2}$
